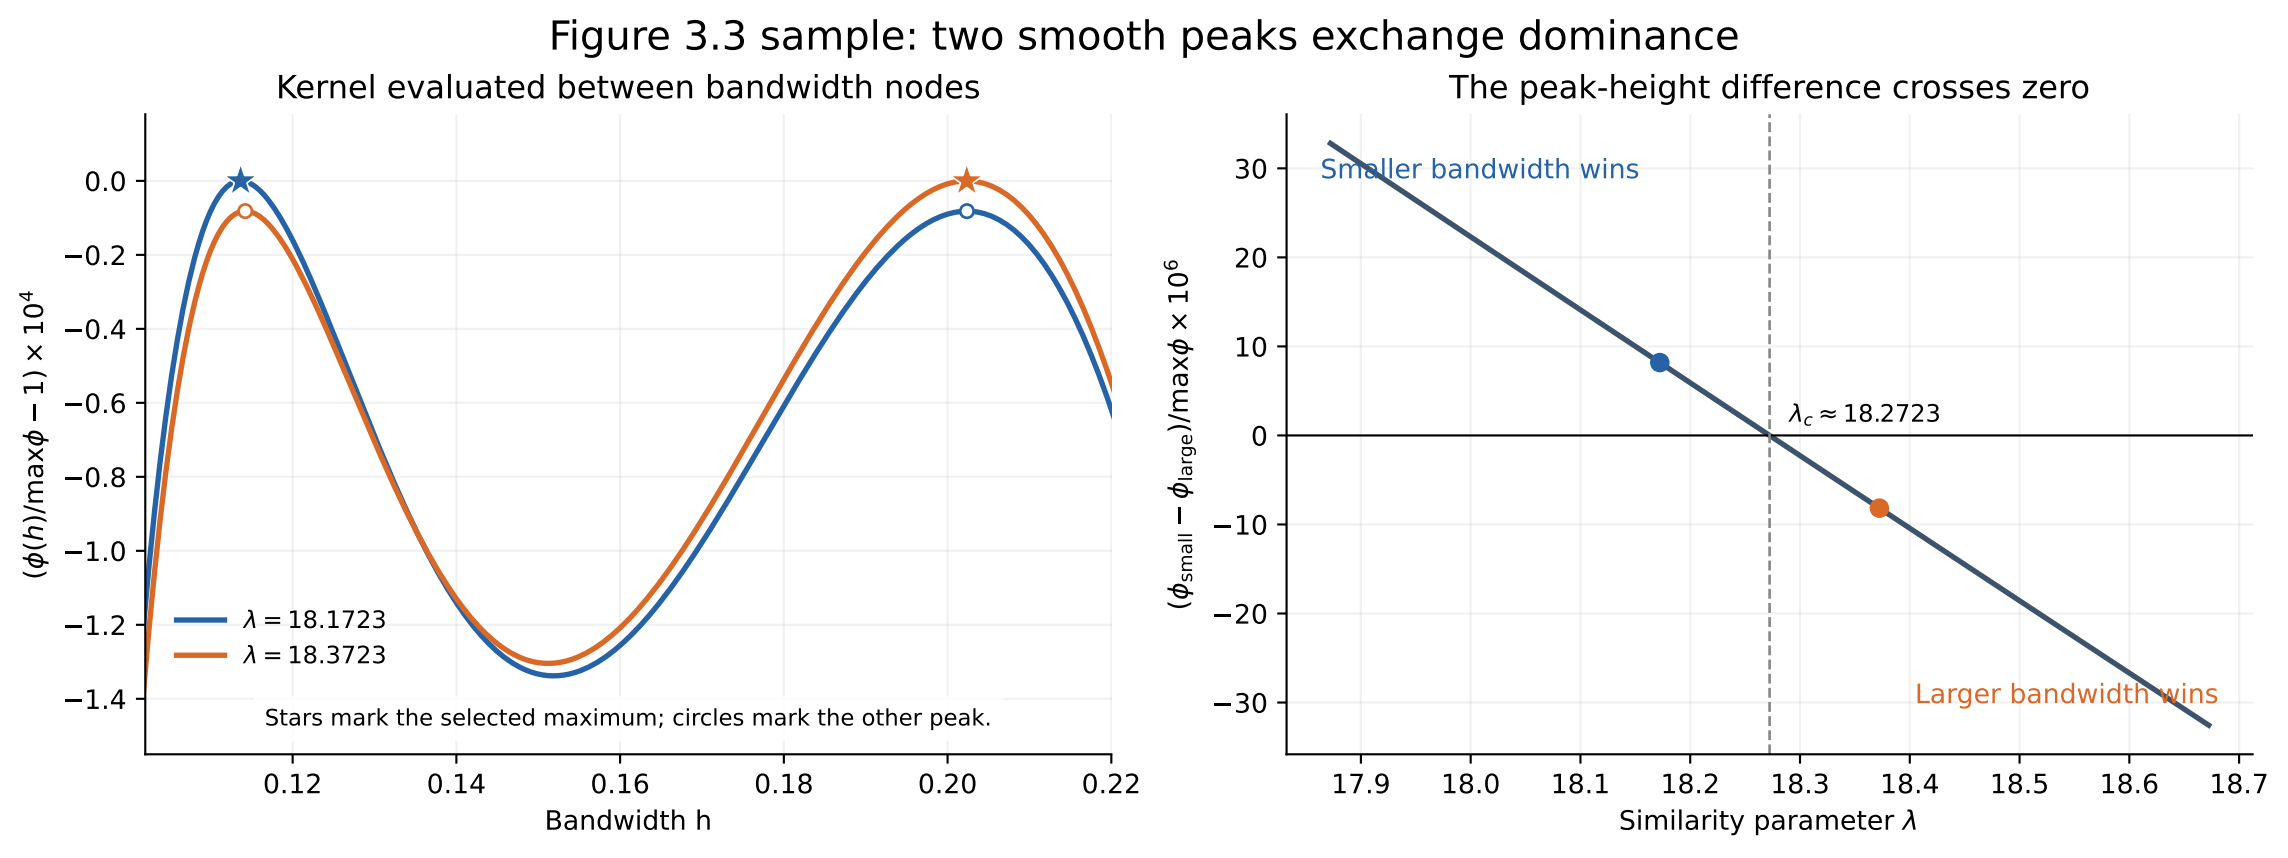

Figure 3.3 sample: two smooth peaks exchange dominance
Kernel evaluated between bandwidth nodes
The peak-height difference crosses zero
$(\phi(h)/\max\phi - 1) \times 10^4$
Bandwidth h
$\lambda = 18.1723$
$\lambda = 18.3723$
Stars mark the selected maximum; circles mark the other peak.
$(\phi_{\text{small}} - \phi_{\text{large}})/\max\phi \times 10^6$
Similarity parameter λ
Smaller bandwidth wins
$\lambda_c \approx 18.2723$
Larger bandwidth wins
