THESIS REVISION GUIDE

Section 3.2: Remaining Tasks

Concrete work still to do, with citation cleanup deferred

The introduction and §3.2.1 have no substantive tasks remaining on this checklist.

Remaining tasks: §3.2.2 and numerical approximation

☐ **Repair the general β-divergence setup.** Reconcile the domain and regularity assumptions with the power generator for general real $\beta > 0$; the current generator is stated for all real arguments. Ensure that the special $\beta = 1$ case is well-defined on the stated domain.

☐ **Align the Bregman symmetry statement with its source.** The statement currently omits the Legendre-type generator assumption of the cited Tsuchida–Nielsen theorem. Establish the needed assumptions or revise the statement so its scope is justified.

☐ **Finish the numerical results presentation.** Add the missing caption to the approximation figure. Distinguish its 200 samples from the 100 samples in the runtime experiment; the current text uses L for both.

☐ **Compile the finished thesis.** Check that the section's figures and cross-references render after the changes.

Based on `Abschlussarbeit_2021/LaTeX/chapters/5_bandwidth_selection.tex` and the KDE numerical implementation. Completed and optional items are omitted.
