Failed and working starting directions: stationarity of the tracked best estimate
Same AR(3) sample | true phi = (0.5, -0.2, 0.1) | gamma0 = 0.1, beta = 0.997
Complete run
First 100 iterations
Failed random start
Working start: $u_0 = (1, 0, 0, 0)$
True coefficients: $\rho = 0.5$
Stationarity boundary: $\rho = 1$
Stationarity measure $\rho(C(\widehat{\phi}_t))$
Evaluated iteration (0 = initial direction)
Measure axis: linear from 0 to 1, logarithmic above 1; the initial zero is included.
