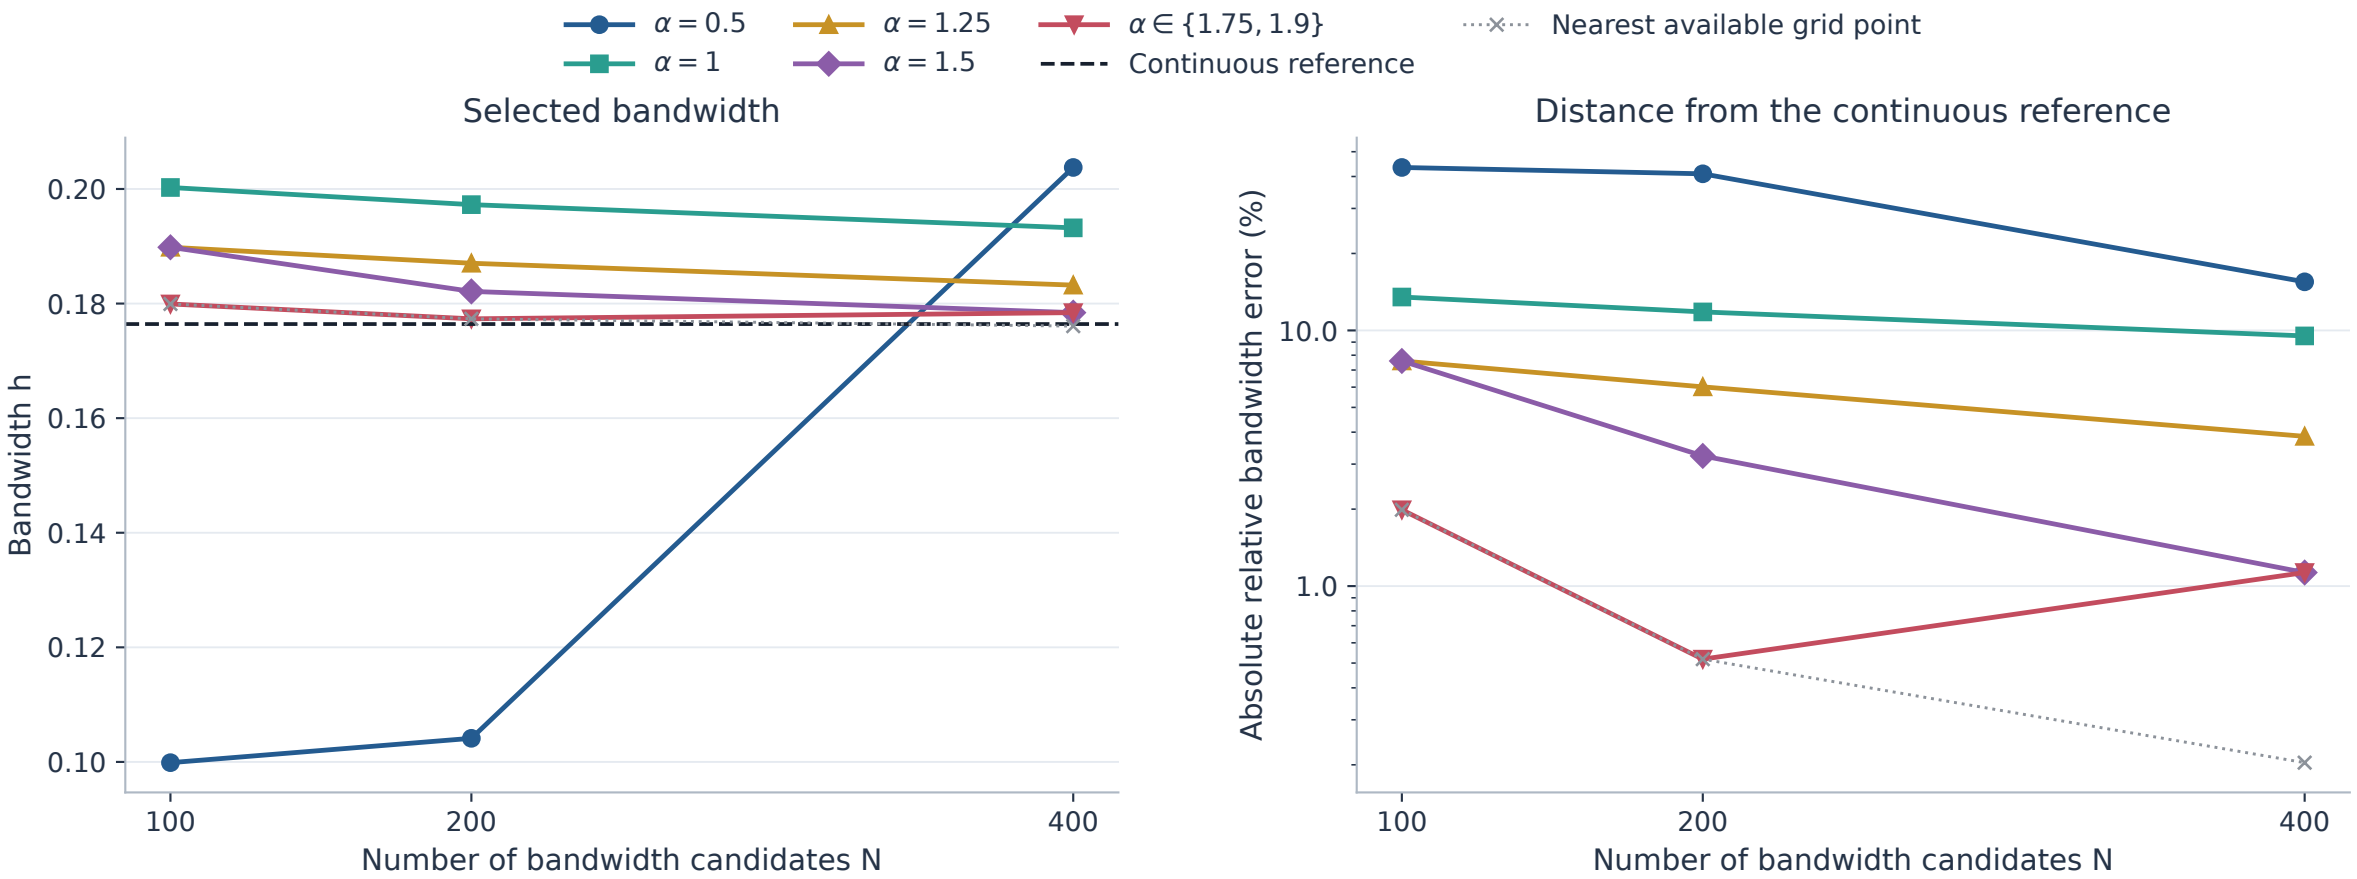
Choosing α on the fixed reference sample

$n = 200$ | geometric grid on $[0.01, 2]$ | $\lambda_N = N^{\alpha}$ | continuous reference h* = 0.176424



Identical paths for alpha = 1.75 and 1.9 are combined. The dotted line is the nearest-grid benchmark.

All 18 peak selections agree after doubling the Fourier frequency resolution. One fixed sample.
