Interior local minimizers: n = 1100 to 2000

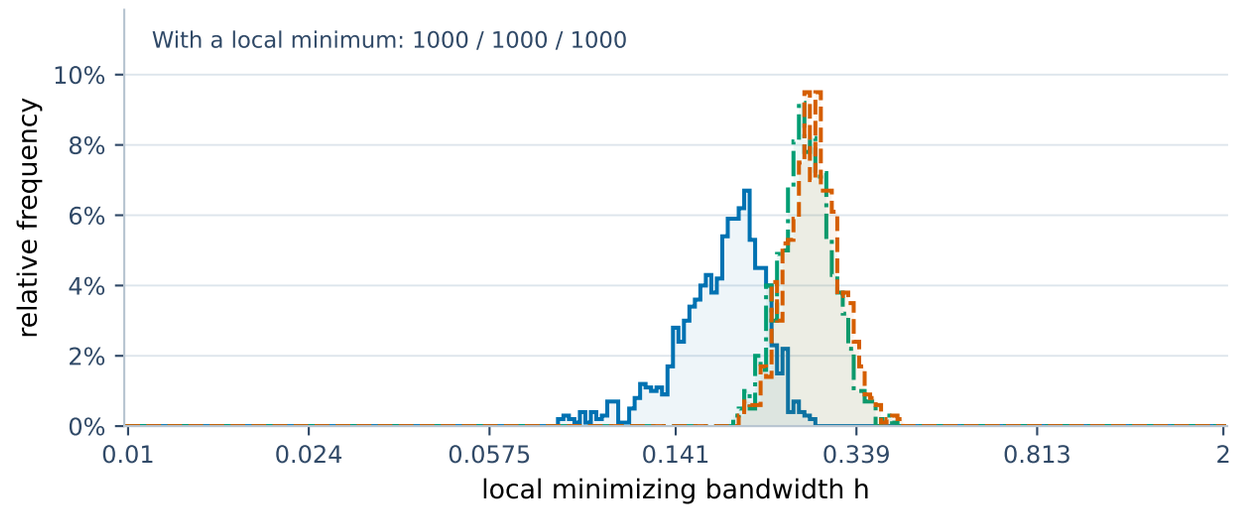

Gaussian samples; M = 1000 per n; local minima restricted to (0.01, 2)

$\widehat{Q}_0$ $\widehat{Q}_{13/14}$ $\widehat{Q}_1$

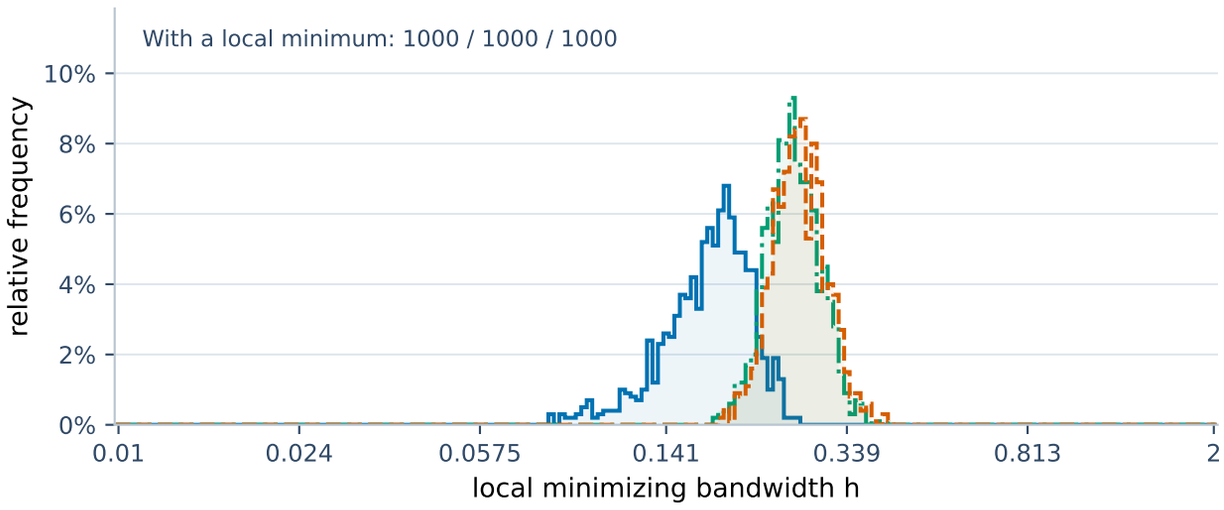

$n = 1100$

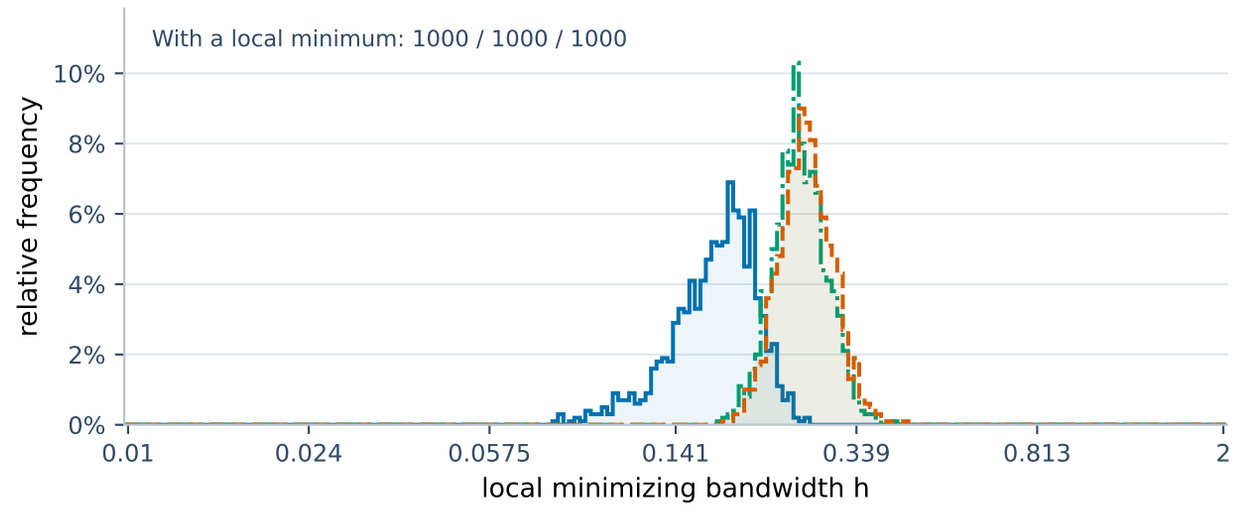

$n = 1200$

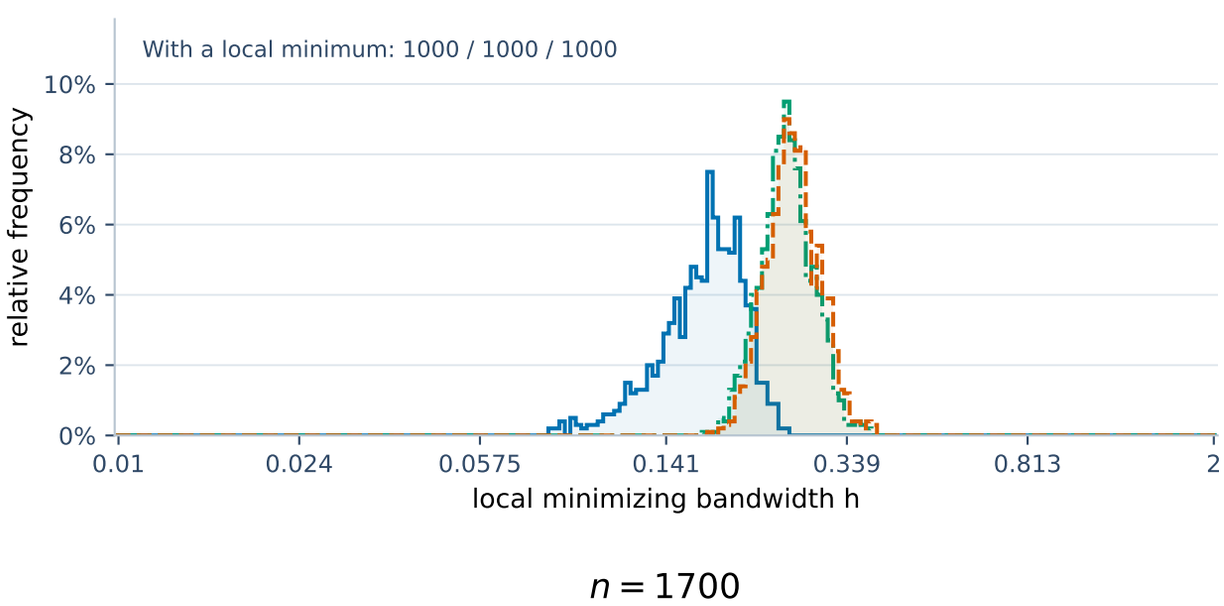

$n = 1300$

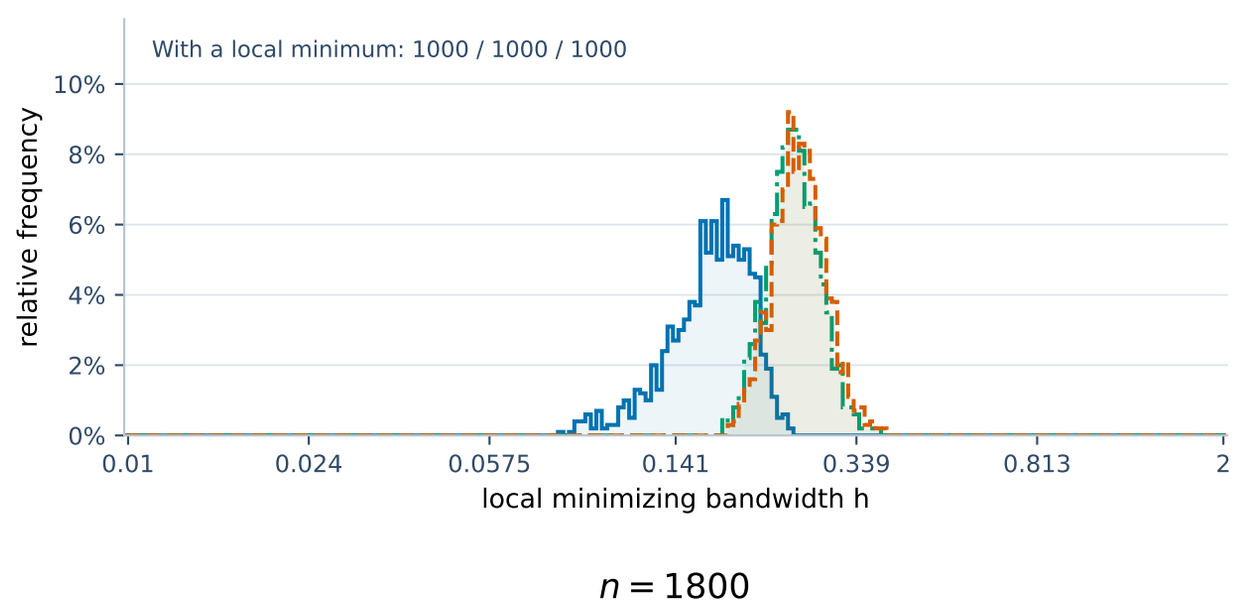

$n = 1400$

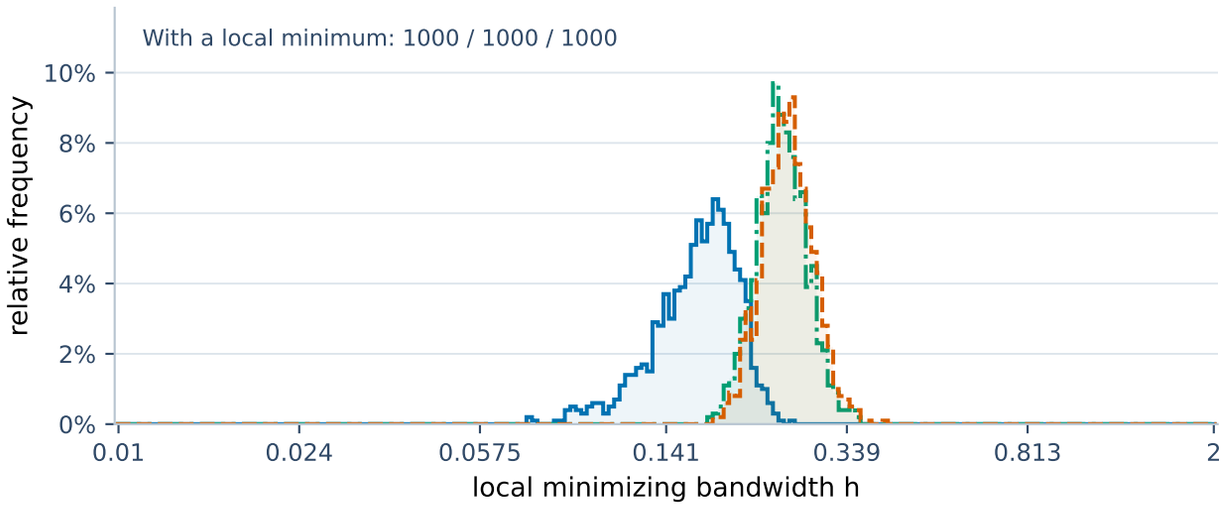

$n = 1500$

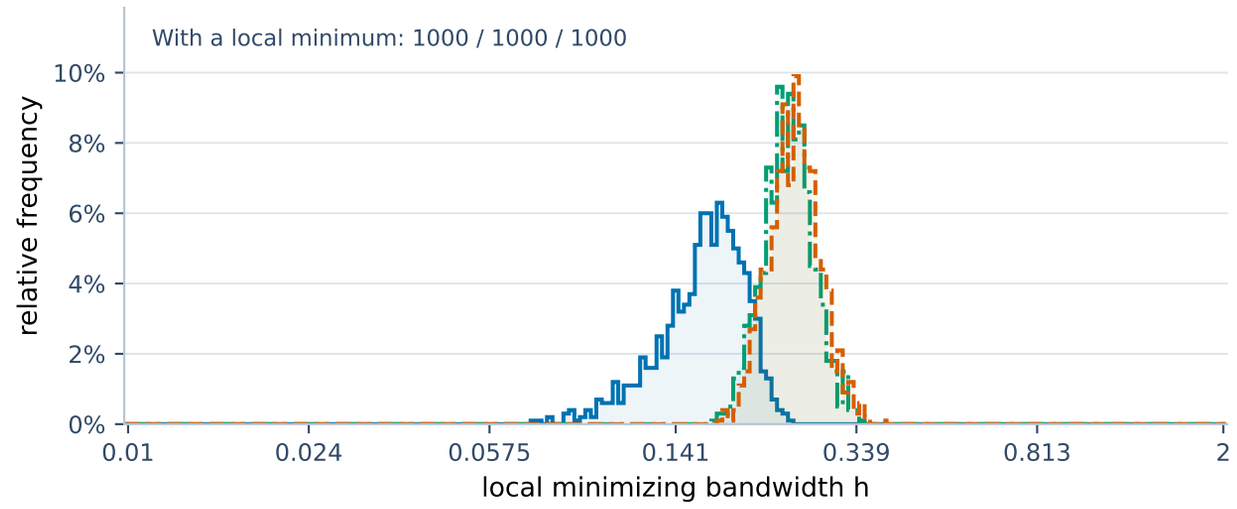

$n = 1600$

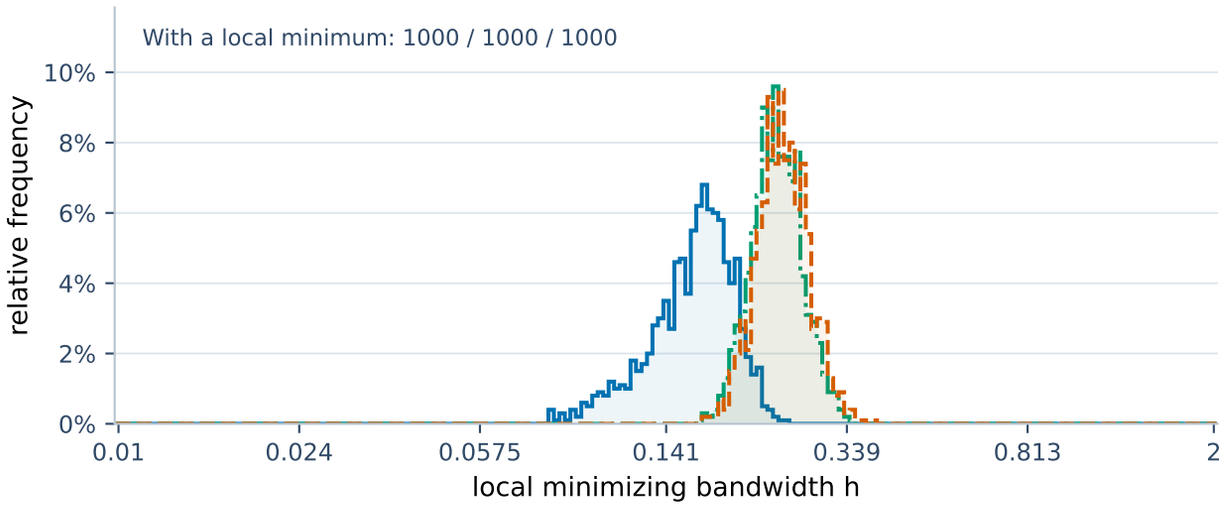

$n = 1700$

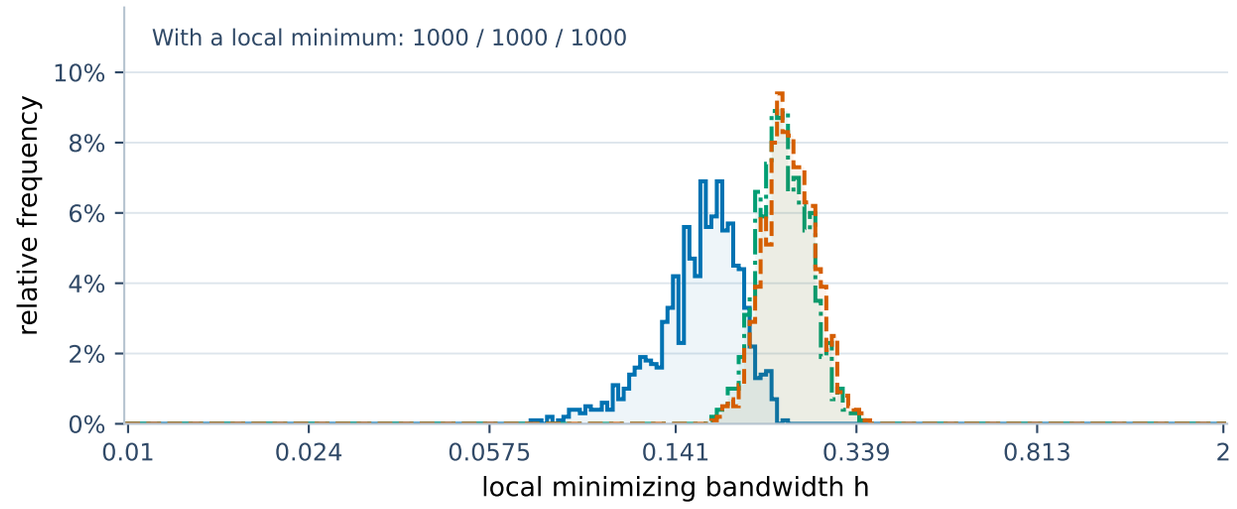

$n = 1800$

$n = 1900$

$n = 2000$

One entry per sample: lowest-energy interior local minimum. Frequencies divide by all 1,000 samples.
Samples without a local minimum contribute no entry. Counts in each panel follow the legend order.
