Interior local minimizers of $\widehat{Q}_1$
Gaussian samples; M = 1000 per n; local minima restricted to (0.01, 2)
$\widehat{Q}_1$
$n = 100$
Local minimum found: 653/1000
$n = 1000$
Local minimum found: 1000/1000
$n = 1500$
Local minimum found: 1000/1000
$n = 2000$
Local minimum found: 1000/1000

local minimizing bandwidth h
One entry per sample: lowest-energy local minimum when several exist.
Bin frequencies divide by all 1,000 samples; samples with no local minimum contribute no entry.
