Inside a failed AR(3) coefficient recovery | true phi = (0.5, -0.2, 0.1)
Same path and sphere algorithm; gamma0 = 0.1, beta = 0.997
Width decreases, but remains above the reference
Original empirical width
Current width
Best width: failed start
Global numerical reference
Evaluated iteration (0 = initial state)
Error of the best-width coefficient estimate
$\|\hat{\phi} - \phi_{true}\|_2$
Failed start
Zero-start control
Evaluated iteration (0 = initial state)
Magnitude of the recovery denominator
$|\hat{u}_0|$
Failed best direction
Global-reference direction
Evaluated iteration (0 = initial state)
Tracked coefficient 1
$\hat{\phi}_1$
Tracked best-width estimate
Generating coefficient
Evaluated iteration (0 = initial state)
Tracked coefficient 2
$\hat{\phi}_2$
Evaluated iteration (0 = initial state)
Tracked coefficient 3
$\hat{\phi}_3$
Evaluated iteration (0 = initial state)
